

ABSTRACT OF THE DISCLOSURE

2 Disclosed are a computer system and an image processing method, that can easily reduce the
3 EMI (electromagnetic interference), introduced into a liquid crystal display using the spread
4 spectrum. The computer system includes a graphic processing unit for converting the image signal
5 provided from at least either of a central processing unit and a memory into a signal that can be
6 displayed on a screen, and a spread spectrum unit, provided between the graphic processing unit and
7 the liquid crystal display, for modulating a frequency of a clock signal from a clock generator within
8 a predetermined frequency range.
